

Lipi — India’s AI Clinical Scribe

Lipi

India’s AI Clinical Scribe

Hindi · English · Hinglish

Documentation assistant for high-throughput OPD clinics

The Problem

India has **1 doctor for every 1,457 patients**. In high-throughput OPD clinics, physicians spend **30–40% of each consultation** writing notes — not treating patients. Existing clinical NLP tools do not support Hindi, Hinglish, or low-connectivity environments. **No solution exists for the way Indian doctors actually speak.**

What Lipi Does

A doctor speaks naturally in Hindi, Hinglish, or English. Lipi listens, extracts structured clinical facts, and generates a physician-ready SOAP note in under 30 seconds.

Doctor says: *"Bukhar hai teen din se, khansi bhi. BP 140 by 90. Paracetamol 500 mg twice daily. Fever above 39.5 ho toh wapas aao."*

Lipi extracts: Symptoms: fever (3d), cough · Vitals: BP 140/90 · Rx: Paracetamol 500 mg BD · Follow-up: if fever above 39.5

Why It’s Safe — No LLM in the Clinical Path

Layer 1: Deterministic NLP	Bilingual keyword lexicon, negation-aware regex, spaCy. Every output is a verbatim transcript span or canonical alias.
Layer 2: GLiNER	Zero-shot extractive NER for medications and investigations. Safety gate rejects any output not found verbatim in the transcript.
Not used	No GPT, no Gemini, no Ollama. No hallucination risk in the clinical path.

Outputs

- **SOAP note** — Subjective, Objective, Assessment, Plan
- **HL7 FHIR R4 bundle** — ABDM-compatible export
- **Consent audit trail** — hashed, DPDP Act 2023 ready
- **CDS alerts** — elevated BP, allergy conflicts

Market Opportunity

Segment	Size	Notes
Licensed doctors in India	1.2 million	TAM
OPD visits per year	600 million+	Transaction volume
Tier 2/3 clinic target	~200,000 clinics	Initial wedge

Languages

Hindi · Hinglish (code-switched) · English · Transliteration (bukhar → fever, khansi → cough, dard → pain, sar dard → headache)

Technology Stack

On-device Sarvam ASR (India-tuned) · Deterministic spaCy NLP · GLiNER extractive NER · FastAPI backend · React frontend · SQLite → Postgres · HL7 FHIR R4

Regulatory Position

Lipi is a **documentation assistant**. It does not diagnose, prescribe, or recommend treatment. All clinical decisions remain with the licensed physician. Physician review and co-signature required before any note enters a medical record.
